What you see is not the egg on the wall and the egg on the floor but what we call the elastic band model. The way we are taught to work with functions is to try to work out how you would break the egg when you are on the floor. You get into trouble because you have to think about the two'seats' of the function and the way the function is rearranged when you are on the floor. It is very counterintuitive. The boundary condition makes everything very clear. We can play the same game on any interval of the real numbers. There is no need to think about breaking the egg and the solution is really quite simple, it is just a calculation. Once you understand what is happening you can't help but wonder what it is like to do a similar analysis on an interval where the left and right limits don't match up. The solution appears to be completely different. This is the case for intervals where the right and left limit of the interval coincide. The solution to the elastic band model for an interval where the left and right limits are the same is simply the average of the two
