Today, the latest version is a very popular graphics program. One of its most advanced features is the ability to process text in a number of different ways. There's no doubt it's a great tool for doing just that, but you might be surprised to find out that it actually originated on Linux. This is the story behind the development of the Text Processor from Camtasia. The first prototype of Camtasia Text Processor Originally, Camtasia Text Processor was a series of applications that came first for Windows and Mac OS X. They were designed to process a single document written in a dozen different formats, including TXT, CSV, HTML, and a couple of others. The creators of these applications believed that they could make a much more sophisticated text processing software than what was available on their respective operating systems at the time. What they actually got was a text processing software with all of the right ingredients, but without many of the necessary tools. One of them, for example, allowed you to easily select the text to be processed, while another ensured that processing was done in a pixel-by-pixel fashion. Both of those aspects are what you get with the final result and its name, a text processor. Now that the initial concept of the software is known, what about its development? The team of developers who originally worked on it consisted of three persons, one of whom has since moved to another part of Microsoft. Before Camtasia Text Processor was released, they released a series of a couple of text processing applications for Linux. Most of them were based on the ideas of Camtasia Text Processor, some were complete overhauls of the original concept. The Text Processor from Camtasia The final result of the Camtasia Text Processor is a freeware application based on the.NET platform. This means it should be compatible with a number of different operating systems, including Windows, Mac OS X, and Linux. An advantage of the program is that it allows you to process text files that aren't necessarily written in a specific format. If you simply want to tidy up a bunch of text for a lecture
