3. Arduino Jumper Wires The Arduino Jumper Wires is a simple expansion shield with two wires that just need to be connected to a prototyping board. The flat solderable part is the breadboard with two large holes which contains the two conductors to connect the jumper wire. Arduino Jumper Wires Description: 5. HC-05 Weather Station The HC-05 Weather Station is a simple wireless weather station to gather weather data and communicate the data back to your computer. The HC-05 has a serial interface in the receiver, and can be powered by batteries or USB. The module has three LEDs and is protected by a dust cap. HC-05 Weather Station Description: 6. Smart Plug The Smart Plug is a plug-in module that connects to the Arduino Uno and Arduino Mega boards, and delivers up to 2A of current. The smart plug also has a USB interface to your computer for programming and has an LED indicator

to signal power and communication status. Smart Plug  
Description: 7. SPI LCD Shield The SPI LCD Shield is an LCD module based on the ATmega16U4 microcontroller.

It is compatible with the Arduino Uno, the Arduino Mega2560 or any other Arduino compatible board. The SPI LCD Shield is a light weight and compact module that has a large screen, a backlight and support for high resolution graphics. The SPI LCD Shield has a User Databank for user settings, a power switch for the LCD screen and 3 programmable buttons. The pins to connect to the LCD Shield are fully compatible with most standard Arduino shields. SPI LCD Shield Description: 8. Flash

LED Shield The Flash LED Shield is a card for the Arduino Uno with extra I/O pins to control the flash of an LED connected to the Arduino Uno board. The LED will turn on and off when the Button is pressed and will turn on when the Button is released. The shield does not have any output or protection and is ready to use. The Flash LED

Shield Description: 10. RTC Shield The RTC Shield provides a real time clock functionality for the Arduino. This is a clock that runs on the Arduino and can be used to read time and date. The RTC Shield is a standalone module and does not require the Arduino board to use the time.

The RTC Shield is very small, light

6. UART Terminal Pro 4.4.0 Description: UART Terminal Pro is a full-featured application that connects to serial ports on your computer and provides data read and send options. The application has been specifically designed to provide advanced features. Configure the baud rate, the data bits, parity and flow control. Save the settings and restore them at the next startup of the application.

UART Terminal Pro Features:

- Connection configuration: via serial port / COM port (automatic or by dialing)
- Host connection (dial-up modem)
- Dictionary with UART message
- Real time data viewing
- ASCII data viewing
- Hex data viewing
- Statistics
- Advanced set of menus
- Save to file
- Restore at the next startup
- Run from floppy disk / CD-ROM
