A small utility to remove the digital signature from PE files. It allows setting certificate details on the command-line. A: You could use: robocsign /a "certificate" /r "certificate password" "client program name.exe" client.pem Robocsign is a shell extension for Microsoft Windows that allows secure updating of programs. It includes the capability to sign your program with a self-signed certificate. A: You can use 7-zip to do it. There's a special SFX spec to sign files. SFX stands for Secured File Format and is a seven-zip specific format that allows for the execution of code directly from a compressed file. According to sevenzip.org, SFX is not a low-level format, but was designed as a format that gives seven-zip the best possible combination of compression, file structure and execution capabilities. This is unlike the SFX format for Unix and Linux systems, which generally rely on the gzip format for compression, and which are generally based on the Portable Executable file format. You can also check out the SFX Spec .. A few years ago, for example, it was considered standard that the gzip format be used for file compression. Today, it is somewhat uncommon to find compression programs that use it, and there are currently efforts underway to further standardize its replacement - LZMA....... LZMA is, in fact, so important that sevenzip.org is placing it front and center in their version 7... This study describes the clinical presentation, clinical complications, and mortality rate of cholera patients admitted to a tertiary referral hospital in an outbreak of cholera in Myanmar. We reviewed retrospectively the medical records of cholera patients admitted to a hospital in northern Myanmar in October 2007. We defined the date and duration of cholera outbreak. The cholera case definitions were based on the World Health Organization (WHO) guidelines. We considered a patient to be a cholera case if he or she had onset of disease and two of the following symptoms: (1) dehydration, (2) severe abdominal cramps 91bb86ccfa

Unsigntool [2022-Latest]

The Unsigntool is a tiny tool that removes Windows digital certificate from a PE file and optionally replaces it with a new one. Unsigntool actually erases the certificate from the PE file using a native tool called CAPI Cryptographic Provider Interface (CAPI). At the same time, it replaces the original certificate with a new one if the DeleteCert parameter is true. The certificate is replaced only if the new certificate is added to the same CertSrvStore as the previous certificate. If a different CertSrvStore is specified, then the certificate will be added to that store. You may specify the cert file name as a parameter, in order for Unsigntool to use the existing cert instead of a temporary one that is generated. Unsigntool also checks the current validity date of the certificate. If it is older than a specified date, the certificate is replaced with a new one. Unsigntool does not do any error handling and therefore is no replacement for proper certificate validation or error reporting. Make sure to backup your certificates before calling Unsigntool, as you should know whether or not the certificate should be replaced and it is best to backup if you need to regenerate one. The Unsigntool can be launched by double-clicking on the executable file or by issuing double-click command from command prompt. To access the menu options, use Shift+F11. In case of a PE file with an invalid certificate, the following message may appear: 'The signature was invalid or the certificate did not match the certificate store.' To replace the certificate with a valid one, just select Replace Certificates…. Use Command-line options: Unsigntool –help Unsigntool –replacecert. Unsigntool –help Unsigntool –replacecert certFileName. Unsigntool –help Unsigntool –updatecurcert DateTime. Unsigntool –help Unsigntool –updatecurcert DateTime Unsigntool –help Unsigntool –searchcert DateTime. Unsigntool –help Unsigntool –searchcert DateTime Unsigntool –help Unsigntool –updatecert DateTime. Unsigntool –help Unsigntool
