When Ohio’s 2007-2011 state legislative sessions came to an end, there were 55 negotiated bills that had to be reconciled between the Ohio House and Senate. An examination of these bills, using a division-of-powers theory, found that the House and the Senate employed approximately equal veto authority in the bill-conference process. The Senate was particularly productive in producing conference vetoes on spending and general appropriations bills, while the House was more prolific when negotiating vetoes on revenue bills and bonding matters. Through the use of content analysis, the study found that, when confronted with conference vetoes, legislators were more likely to engage in issue advocacy and provide explanations for their votes on the vetoed bills. Finally, bill-conference vetoes were used to create more democratic opportunities for citizens to participate and influence their state legislatures.Obama isn’t the type to waste time – he has to get a bill passed by the end of the month. He also wanted to make sure the Senate and House had a chance to review the legislation before its official passage, since it’s a big bill. But now that the bill has passed, that’s no longer the case. Obama wants to sign it into law as soon as possible, since he doesn’t want to wait around any longer. Even though it isn’t official yet, he wants to get it passed so he can move on. BREAKING: Obama Wants Congress to Pass Legislation ASAP Obama wants to pass and sign a bill ASAP (Photo by Drew Angerer/Getty Images) You may know already, but the federal government isn’t technically shut down yet. The Obama administration still has a few things to do to get the government up and running. So Obama

FlexGrid allows you to quickly create a GUI with a data structure of your choice by drag-and-dropping visual elements on a design surface. You can easily create new columns and rows and add or delete existing ones by only specifying the cell span, sorting or filtering options. FlexGrid provides multiple predefined sizes for each element to suit different screen resolutions. FlexGrid Visual Components: Height Width BorderWidth Padding Height and Width defines the area in which layout happens. The BorderWidth defines the space between two elements. Padding creates space between elements. The result is the space between each cell. Flexgrid Grid Column and Row: The user can assign a data value to a cell by either setting the cell value manually or by using a PropertyTemplate where the DataTemplate defined sets the cell value. The grid column and row defines the height and width of the cell. Row and Column Defaults AutoGenerateColumns and AutoGenerateRows: This property specifies whether the grid automatically generates columns or rows when a user specifies a width or height. Direction: It defines the direction of the grid’s layout. Default value is horizontal. ColumnSpan and RowSpan: These two property define the column and row span of a cell. Specify the value as an integer (for example, “2” indicates that two rows of the cell can be displayed). Column Definition: This property defines a cell’s visibility within the grid. The column is visible only when ColumnSpan = 1. Default is true. RowDefinition: This property defines a cell’s visibility within the grid. The row is visible only when RowSpan = 1. Default is true. ColumnDefaults: This property defines the default values for the grid’s columns. By default, the columns are sorted by data value. RowDefaults: This property defines the default values for the grid’s rows. By default, the rows are sorted by data value. ReadOnly: ReadOnly property specifies whether the cell is read only. Default is false. CheckBox: The CheckBox is a visual component in Studio for WinRT XAML. It allows the user to easily select or deselect a check box. ToggleButton: The ToggleButton is a visual component in Studio for WinRT XAML. It allows the user to select or deselect a toggle button. TriangleButton: The TriangleButton is a visual component in Studio for WinRT X 09e8f5149f
