Swing Testing Toolkit is a Java library that supports the development of automated tests for Swing applications. It is an open-source library that enables Java users to create test cases, carry out test executions and analyze the results of the latter. There are two major ways of developing and executing Swing tests: 1. With GUI testing tools. These can either be fully automated, in which case they interact with the application under test using a protocol that has already been built and adapted to the GUI technology, or semi-automated, in which case the testing tools are directly connected to the GUI component and the required protocol is created by recording the test instructions and the test case. 2. With an expert testing tool. These tools are independent of the GUI technology and execute the test cases directly, without the need for any intermediary communication protocol. A third, hybrid, way of developing and executing Swing tests is offered by Swing Testing Toolkit: The test cases are developed using a GUI tool, which then controls the execution of the test cases and finally converts the test results into a single analysis report. Swing Testing Toolkit Functions: Swing Testing Toolkit, along with the test case generator, is written in the Java programming language. It is a library that enables Java developers to create, execute and analyze test cases. The library offers two ways of creating test cases, using the GUI testing tool or an expert testing tool. These are then used to execute the test cases. Swing Testing Toolkit Testing Coverage: Swing Testing Toolkit is a fully extensible and reliable library. In fact, through its API, other developers can create custom test actions. Furthermore, Swing Testing Toolkit is highly extensible and offers users the option of using the Groovy language in order to extend the capabilities of the library. Swing Testing Toolkit License: The Swing Testing Toolkit is available under the GPL License. You are free to use it, modify it and make it your own. This is also true of the custom test actions and other custom modules. Swing Testing Toolkit Provider: The Swing Testing Toolkit is available from its provider, upon request. Advantages of Swing Testing Toolkit: 1. The Swing Testing Toolkit provides an API that can be used in any Java environment to create, execute and analyze test cases. It is especially well-suited to test the core functionality of Swing applications. 2. The Swing Testing Toolkit is fully extensible. In other

ApplicationTestSuite is an executable Java package for creating, running, recording and editing test cases against Swing components. The component finder is enabled by default. However, new finders can be created on demand by adding them to the test suite's configuration. Some of the test actions are enabled by default. To obtain the others, simply add them to the test suite's configuration. AUTOMATEDTESTINGDescription: The automated testing is performed in two different ways: - Using an argument list - Using a configuration file For the first method, the following example illustrates a test case against a JPanel component. # define a panel # define its label # call the test case package testing.swing.samples.testcases; import java.awt.event.ActionEvent; import javax.swing.AbstractAction; import javax.swing.JFrame; import javax.swing.JLabel; import javax.swing.JPanel; public class S1 extends JFrame { JLabel label = new JLabel("This is a label"); JPanel panel = new JPanel(); S1() { setLayout(new BorderLayout()); panel.add(new JLabel()); panel.add(label); setSize(400,400); setLocation(10,10); setVisible(true); setDefaultCloseOperation(EXIT_ON_CLOSE); } public static void main(String[] args) { new S1(); } }

call the test case package testing.swing.samples.testcases; import org.oracle.jfr.SampleTestCase; import org.oracle.jfr.TestRunner; import org.oracle.jfr.TestSuite; public class S1TestSuite extends TestSuite { public S1TestSuite(SampleTestCase[] tc) { super(tc); } public void run() { TestRunner runner = new TestRunner(); runner.setTestLoader(getTestLoader()); runner.setTestCase(new S1()); runner.run(); } public static void main(String[] args) { TestSuite.forTestClasses() .addTestClass(S1TestSuite.class 1d6a3396d6

The Swing Testing Toolkit, as the name implies, aims to assist users in testing Swing components. After testing is finished, logging is possible, as well as displaying a report for later viewing. The library is highly customizable, with new components being added for inclusion in the tests. Its test recording component, for instance, is only the tip of the iceberg. Customized actions, including actions to test certain types of input fields, can be defined using the XML specifications. For instance, test actions such as "click to activate," "type to achieve action," or "type to capture keystroke" can be defined. Other features include the element finder, which is designed to simplify the testing process for users by enabling the selection of specific components in a graphical way. Additional test cases can also be generated on the fly, through the recording of interactive tests. This can help to achieve maximum efficiency when dealing with Swing applications. The library can be used as a part of Eclipse or NetBeans plugins, with support for testing having been added in both instances. It is also possible to integrate the library into the IDE, including the capabilities of attaching or detaching testing to any moment of the IDE's lifecycle. Java Swing Testing Toolkit Review: Some of the functionality of the library aims at offering developers the means of testing the GUI components of their programs. Based on Java technologies, the toolkit is highly extensible, with new components being added on a regular basis. Testing is achieved through a series of automated test cases, with a number of features being offered for recording and processing these test cases. As for the testing framework, it is highly customizable, thanks to the XML specification. The log reporting is among the possibilities offered. The test recording functionality is of utmost importance, as it enables maximum efficiency, while the element finder is also of great use. Users can easily select components from the layout or from the screen. The library also offers a powerful set of test case generators, including test actions for recording keystroke and mouse actions, to name a few. Such test actions are defined using XML specifications. Additional test cases can also be generated on the fly, through the recording of interactive tests. The Java Swing Testing Toolkit can be integrated into Eclipse and NetBeans plugins.
