Most chlorinated compositions contain peroxides as oxidizing agents. For example, trichloroisocyanuric acid (trichloroisocyanuric acid, TCCA) has been used for bleaching. However, such bleaching compositions containing TCCA have been found to be unsuitable for certain fabric and dish applications. For example, TCCA may react with the fabric and cause discoloration and/or staining of the fabric. Peroxides have also been used as oxidizing agents for bleaching. For example, peracetic acid has been used to bleach textiles. However, peracids are unstable and decompose to carbon dioxide and oxygen. Decomposition of peracids releases energy that can degrade substrates such as, for example, bleachable materials, enzymes, proteins, fabrics, dishes, and/or other substrates that are contacted by the peracid. Antimicrobial compositions containing peracids have also been used. However, many peracid compounds, such as certain peroxydicarboxylic acids, are only moderately active, and some are inactive against even certain bacteria such as, for example, Bacillus subtilis. Additionally, many known compositions containing peracids are unstable and decompose to carbon dioxide and oxygen. Accordingly, there is a need for stable compositions that can effectively bleach substrates. In particular, it is desirable to provide compositions that are effective at bleaching substrates (such as fabrics, dishes, etc.) and/or that are more effective at bleaching substrates than known compositions. The use of NMDA-receptor antagonists as tools for dissecting the rhoA/Rho-kinase signaling cascade in smooth muscle. RhoA/Rho-kinase signaling was found to play a pivotal role in the regulation of smooth muscle contractility. Rho-kinase inhibitors as well as physical and pharmacological tools have been used to analyze the role of RhoA/Rho-kinase signaling in smooth muscle. NMDA receptor antagonists have also been used with success to dissect the RhoA/Rho-kinase 570a42141b
