The present disclosure relates to spinal surgery and in particular, to intervertebral distraction with bone anchors and a method for performing spinal surgery. Degenerative, traumatic or iatrogenic pathologies of the spine can lead to chronic back pain and/or neurological deficits. Spinal decompression may be indicated in the event that one or more of the anatomical structures of the spine have become compromised. The goal of surgical decompression is to decompress anatomical regions compromised by the

pathologies and/or create anatomical space for the treatment of spinal stenosis. This is commonly achieved by laminectomy, with or without the use of expandable decompression tools. Spinal stenosis and hemangiomas are the two most common indications for surgical decompression of the spine. Spinal stenosis is a progressive narrowing of the spinal canal, which may cause compression of nerve roots and the spinal cord. Spinal stenosis can be caused by any of a number of factors that cause the production of bone, soft tissue and other elements that compress neural tissue, thereby impinging nerve function. Symptoms of spinal stenosis

include leg pain, which may radiate to the feet, and/or neck pain. Hemangiomas are benign tumors that can occur in bone, soft tissue and within the spinal canal. Conventional surgical techniques are invasive and may leave patients with a large scar.

What makes Netflix say "we deliver"? What differentiates the Netflix's mothership service from other similar services is hard to put a finger on. The site, for instance, boasts that all of its movies and shows are streamed "instantly to any internet-connected TV", while rival Amazon Prime also makes movies available via streaming, as do Apple and Google. There is no doubt that Netflix's

catalogue is immeasurably larger than Amazon's, and neither is there any denying that Amazon offers a much wider range of movies and TV shows than Netflix, but the fact remains that when choosing a streaming

Hostr is a reliable file sharing program which allows you to quickly upload content to a specified cloud account. The application allows you to store files in your cloud and acquire the URL without even opening your browser. Moreover, it allows you to capture custom sized screenshots and instantly upload them. File sharing made easy Hostr requires

that you create an account for yourself, in which to store files for transfer. The software ensures quick upload, accessibility and safe transfer for pictures, music, documents, archives and many more types of files. All you need to do is open the desktop application, add the files by dragging and dropping them in its interface. The upload starts instantly and the duration of the process is indicated on the progress bar. As the transfer is finished, you may acquire the URL for the specific file, by copying it to clipboard. When opened, the main screen of Hostr displays some of the latest uploads; you may change the number of files in the list, from the

Settings tab. Otherwise, the URL can be acquired by visiting your online Hostr account. Capturing screenshots Hostr is suitable for sharing desktop activity with your friends, via the Internet. Thus, you may use the desktop capturing function to create a custom sized screenshot and instantly upload it to the cloud. Simply select the dedicated command from the top ribbon, then set the size by dragging the lower-right corner of the frame.

Alternatively, you can capture a screenshot containing the selected active window. This function comes in handy if you wish to share screenshots of a particular application. The files are automatically uploaded to the cloud as

soon as they are created. Simple to use file sharing application Hostr can help you upload files to your cloud account, then share them via the Internet with other users. The URL is generated as soon as the upload starts, so you can copy it to clipboard and importing it into an email or message. You may share a wide variety of files or send freshly captured screenshots. You may save them with a custom name and as.PNG,.JPG,.BMP or.GIF files. designed to offer a better alternative to
the open-source Git. Since Git is quite
limited in features (Git-Smart-SVN is
solving all those issues). The combined
features of Git & SmartSVN make it a
very powerful tool for any individual or
team of users. SmartSVN increases the
productivity of every developer using a
Git repository. For example by letting

you create your own branches and merging your changes directly into your branch when required. SmartSVN has amazing features for those working with Linux kernel/userland/user space projects. It has been used in commercial enterprises and research institutions to replicate SVN on a large scale with significant user base (Git allows this but is not perfect for large teams). So what is it? SmartSVN is an SVN to Git converter, allowing you to perform all your SVN actions within a modified Git repository. It's easy to use, just run the executable and configure the necessary options (like Git transport, local branches, etc...). The configuration used

for the tests was GitTransport.net, with all the necessary settings (as specified on the website). It can be configured to use Git or SVN repositories. It can be used to convert the source code or any binary files (it's possible with a large number of files in SVN repositories). With SmartSVN you can perform git operations and all the functionality needed to use a SVN repository, as a part of a Git project. SilentSVN 2.1.0 build 35684 SilentSVN is a free, Open Source Subversion client that records history so you can always see exactly what's happened to your repository. SilentSVN is NOT a command-line version of the Subversion 1.x server. It requires a

Subversion server installed and running on a host with internet access, which will be used for uploading the repository to and getting repository data from. There is a
