Wondering what is a pixel? A pixel is a picture's smallest unit. It can be either a single dot or a collection of dots. Some software, such as Microsoft® Paint, represents the pixel as a small square. Some software represents the pixel as a dot. A pixel may take many different formats. The most common formats are indexed mode, RGB mode, CMYK mode, Grayscale mode, and more. Indexed mode Indexed mode is the most common form of pixel in a picture. With indexed mode, the pixel is a single small dot or a number of dots. Each pixel is assigned to a number by the program that converts the pixel into indexed mode. The number tells the computer how many dots are within the pixel. When you create a file in indexed mode, you choose the number of dots for each pixel. You also choose which color each pixel is within the picture. RGB mode RGB mode is another common format. With RGB, each pixel is a collection of colors. The colors change with each pixel. You can use a rainbow effect to change the colors in the picture. CMYK mode CMYK mode is a more complex way to create a pixel. With CMYK, the pixel has four colors: Cyan, Magenta, Yellow, and black. Each color must be within a certain area of the pixel. You choose which areas belong to each color. This format is used most often when printing your picture. Grayscale mode Grayscale mode is the least complex method of creating a pixel. In grayscale mode, the pixels are shades of gray. Each pixel is a bit of gray. You choose the color of each pixel. Color mode Color mode is the most common way to create a pixel. With color mode, you choose a color that will go with each pixel. Saving picture files After you have created your picture, you must save it. Pictures can be saved in many formats. You can save a picture in the formats listed below: jpg: JPG, the JPEG format, is the most popular format for pictures. JPEG is the best format for pictures because it lets you use the file without damaging it. You can convert the picture from RGB mode to indexed mode and then back to RGB. bmp: BMP is a large file format. It creates a large
