The following article is one of a series of entries in the Looking Under the Hood collection, which examines the inner workings of Autodesk products. This article looks at the.NET programming environment, which is the language that programmers use to create the source code for Autodesk products. I. What Is the.NET Programming Environment? The.NET programming environment is the set of tools and libraries available to developers who write programs for Microsoft's.NET Framework. Microsoft's.NET Framework is a set of standards that enable software applications to be written to interoperate and to execute on multiple hardware platforms. The.NET Framework supports cross-platform development and enhances the development of software for the Windows platform. In the.NET Framework, Microsoft created two language constructs: the common language runtime (CLR) and C#. The CLR is the virtual machine that executes Microsoft's.NET Framework's C# language. C# is a compiled version of the object-oriented C-like programming language, which is similar to C++ and Java. The CLR provides the execution engine for the.NET Framework. The C# language was developed by Microsoft in response to requests by application developers who wanted a more powerful and efficient alternative to the C++ programming language. Today, C# is the preferred language for developing.NET Framework applications. II. What Are the Fundamental Components of the.NET Framework? The.NET Framework is built on several of the features and technologies that Microsoft developed to support its Internet and network-based services. The following list includes some of the fundamental components of the.NET Framework. Microsoft Silverlight, which is a browser plug-in for Windows, as well as Mac and Linux. Windows Communication Foundation (WCF), which is the distributed, scalable, reliable, interoperable messaging infrastructure included in the.NET Framework. Windows Presentation Foundation (WPF), which is the user interface (UI) infrastructure for the.NET Framework. Windows Workflow Foundation (WF), which is the.NET Framework's workflow management and automation engine. The Common Language Runtime (CLR), which is a virtual machine and execution engine that supports the development of software that can be executed on the.NET Framework, Windows, and other platforms. Microsoft Enterprise Services (e.g., SQL Server, SharePoint Server), which are the enterprise software products that are used in combination with the.NET Framework. III. The

Similar formats are supported by other packages such as Revit. Autodesk's

corporate security policy uses a B2B network called "Entrust" to connect its corporate users to partner companies' networks. This can be used by Autodesk to limit access to the Autodesk applications by users, or to limit access to Autodesk applications by non-Autodesk programs or websites. Autodesk's products are licensed using a computer-based licensing model, whereby users may purchase subscriptions, annual licenses and perpetual licenses. To enhance the customer experience, Autodesk introduced the Anywhere Collaboration Service, allowing remote users to share, edit, and view 2D and 3D drawings and presentations anywhere in the world as if they were in the same location as the Autodesk users. File formats Autodesk supports most industry-standard CAD file formats. The native formats are: AutoCAD Activation Code DWG, DGN, PDF and DXF. The parties involved may be friends, family or work colleagues. The number of people who are part of this conversation may be greater than the number of guests. The "conversazione" ends with a round of cicchetti, little snacks that are drunk in little glass cups (cicchetti = dregs). During the conversation, all the bottles are opened at the same time. Generally, the more expensive the wine, the more people are invited. In Italian restaurants and more expensive places, people usually bring their own bottles to the "conversazione".
