[b]samsad bengali to. The present invention relates to mechanical devices that enable a user to load and unload cartons and containers. The patent literature is replete with examples of mechanical devices that attempt to facilitate the loading or unloading of objects. These devices fall into two broad categories: devices that

engage the outside of the container and devices that engage the inside of the container. Examples of the first category include, for instance, U.S. Pat. Nos. 5,944,028 and 5,737,791.

As an example of the second category, a typical device of this type has a container-engaging rod that is insertable into the interior of a container and a plunger that is moveable along the rod. When the plunger is pressed down against the

bottom of the container, the plunger engages the bottom of the container and urges the container to the upward position. When the plunger is released, the container drops into the container-engaging rod. As a general rule, the closer the container-engaging rod is to the bottom of the container, the greater the force required to depress the plunger to engage the bottom of the container. If the movement of the

container-engaging rod is relatively slow, the force required to depress the plunger is relatively low. If the movement of the container-engaging rod is relatively fast, the force required to depress the plunger is relatively high. Mechanical devices of this type are commonly provided with means for adjusting the speed of the plunger and the rod to accommodate containers having different depths.

Various devices have also been proposed for adjusting the vertical position of the container-engaging rod. For instance, certain devices require the user to push a button on a handle of the device to move the rod to a desired position. Other devices have to be adjusted by rotating a screw or other component having a corresponding pitch screw.

There is a need, for instance, in the trucking industry for a mechanical

device of this type, but which eliminates the requirement for a manual adjustment of the device by a user to move the rod to a desired position. The present invention provides such a device. d0c515b9f4

crack.JEHI JEHI, or JEtHi, may refer to: Jehi'a, a type of

sacred stones found in a number of locations in Israel
Jěhi'a, or JEtHi, the name of a lava-crystal-sandstone
deposit discovered in Bačka, Serbia Johankopet
(Johane/Jehenkpore), an early village in India JEHI, an ISO
2108 code for Jean-Joseph Arago. The letter-forms JEHi are
used to represent the English compound words "John" and
"Jesus" in designs on the Eucharist: In the sacrament of
Holy Communion in the Catholic Church, the Eucharist is
consecrated, and part of it is reserved for the minister, and
the remainder is consecrated into the Body and Blood of
Christ (Benedict XVI) This design is shown on the corporal
(Eucharist host) The Eucharist is consecrated into the Body
and Blood of Christ, but also shared and received in
communion among the faithful (or simply received, or even
reserved for consecration) This design is shown on the
chalice (Eucharist wine) Category:Alphabet Category:Index
(publishing) Category:Bible in popular culture This invention
relates generally to flow control apparatus and more
particularly to a rotatable flow control member adapted to
operate in conjunction with a flow of water, typically water
from a faucet spout, which is operated by a mechanically-
linked remote control unit. A number of flow control
devices, which may, for example, be called shower valves,
are already known in the prior art. Flow control devices for
controlling the flow rate of water, or for controlling the
temperature or quantity of the water are commonly used
in shower stalls, tubs and the like. In this regard, reference
may be had to U.S. Pat. Nos. 3,763,701, 3,997,004 and
4,100,978
