This invention relates to a dental appliance, and in particular to an improved method and apparatus for aligning a tooth of a patient with a reference axis during a dental crowning operation. The process of dental crowning, or shaping the crown or cap portion of a tooth, is well known in the art. In one well known method a coping or crown is formed in the shape of the dentition, or tooth shape, in a mold. This is usually formed of plaster, which in turn is formed in the mouth of a patient. After the formation of the mold, the coping is then bonded to the tooth of the patient. During the bonding process, or bonding of the coping to the tooth, it is necessary that the coping be properly aligned so that the coping is at a predetermined angle to the reference axis (usually the long axis of the tooth) of the patient. In the past, this required two operators; one to hold the coping in its position of alignment during the bonding process, and a second operator to measure the position of the coping in order to form a proper bond between the coping and the tooth. There are many problems with the method as described above. To begin with, the coping can be easily misaligned to an unacceptable degree by one of the operators, so that the tooth crown cannot be properly formed in the patient. The measuring process is often inaccurate and, therefore, useless. Finally, the method is difficult to use and does not adapt to use with any particular dental apparatus. A number of attempts have been made to correct this problem. For example, in U.S. Pat. No. 4,781,152 issued Nov. 1, 1988 to Mark A. Parrott, a series of calibrated brackets are secured to the tooth to be crowned, and a sighting rod is positioned with reference to the brackets. This is an exacting process, since it is not possible to see the brackets from the operator's station, and moreover, the brackets are very difficult to adjust in position in a dental field because they are designed to be held in place by the patient. Further, the brackets must be used with a specific apparatus which may not be available or is not convenient in the mouth of a patient. In addition, such brackets are unable to provide accurate
