Freedownload.rtf is a free and fast download manager that runs on any platform. Many softwares have been removed from our database or have been replaced with freeware apps. So if you are an ebook author and want to check your ebook free download potential, youÄ .Q: Clean and safe way to ensure a process call will finish in C I have a situation where I want to periodically check on a process (launchd or cron daemon) and if the process is not running, just start it using launchd. How can I ensure the process will finish? I guess the best way would be to use a semaphore in the parent to prevent other threads from using the process, but is that safe? A: Is it safe? Probably, since there can't really be contention as the system will only have one copy of the daemon running at a time, you have to watch out for the signal handler that signals when the process ends, so unless you kill it the parent program will keep it around. Is it "clean"? Probably not, since locking it out for 10 seconds, or 10 minutes, even if that's all you have to do, seems like a dirty thing to do, but in this case, since you're communicating with the daemon itself rather than doing more

complicated things, and since you have no control over how long it takes for the daemon to exit, this is probably the only way to be sure. If you were going to do something more complicated, you might want to use a third-party daemon to run your own process, to not have to worry about it. Q: What is the smallest value that could be stored in a signed two's complement integer register? I have been trying to find the answer to this problem without much success. What is the smallest value that could be stored in a signed two's complement integer register? A:

$$-2^{31} = \lfloor -2^n \rfloor$$
