

* **Fade to Black**. This tool enables you to add and remove black from an image without affecting the color of the image.

You can also fade colors to a darker shade. * **Channel**. This tool is one of the most important tools of the Photoshop interface. It's a tool for adding, erasing, removing, and bringing channels into and out of an image. Channels are groups of pixels that are related to one another, so you can treat the colored pixels in a channel as a single color. For example, you can make the pixels in a Red Channel transparent by changing the Red Channel layer's mode from Normal to Transparent. * **Blur**. This tool enables you to blur or soften an image. You can take the sharpness out of an image or blur the movement out of the image. You can blur an image beyond what you can see with the naked eye. * **Color Curves**. This tool allows you to manipulate the overall tonal range of an image, letting you bring the overall color balance of a picture closer to what you see in front of you. You can use the Curves tool to add color saturation and contrast to your images. * **Crop**. This tool enables you to crop images.

You can crop an image to get rid of the bottom or top or both of the image. You can also crop your images horizontally or vertically to make them fit a specified size in an image. * **Dodge and Burn**. You can use this tool to lighten areas of a darker image and darken areas of an image that's too light. * **Draw**. This tool enables you to make paintings in Photoshop. * **Embed Color**. Use this tool to insert an embedded color into a new layer. * **Effect Layers**. This tool enables you to use special effects. You can add special effects to an image to give it a wavy, glittering, glassy, or warped appearance. You can apply many effects at once. * **Eye Dropper**. Use this tool to select a color and then copy it to another area of the same image. * **Filters**. This tool is one of the most powerful tools in Photoshop. With filters, you can give your images a special look. You can add special effects, such as a neon

Q: Is it ok if I constantly add new entries in a database even if it's only going to be a boolean value? I have a website where users can create and submit notes. If the user adds a note and it is approved, the note will be added to a database table. If the note isn't approved (and doesn't get submitted via a form, I click a link to approve it), it is removed from the database. My Question is: Is it safe or dangerous to add new values into the database all the time? These are only booleans. Should I only add values into the database that are going to be persistent? Do I have to worry about a certain percentage of notes in the database turning into spam? This is for a private notes system for a business. The data in the database is kept private, but it's still public so any note can be found and read. A: This is all about how you're using it. If you're just using it to track notes, or are going to use it to track something else, and it's only a boolean value, I wouldn't be concerned. However, if you're going to use it to log what the user has done on your site (whether it be add a note, select one, add another, etc), I'd say this is a little more hazardous. It's a simple boolean value. People aren't going to use it to identify themselves (unless of course you have a policy on what they can do with it), but they can run a user script that will add all of their notes. So, it's a simple value, but don't be afraid to use it as a means to track their actions for future projects. Meet Blade, the deadly-stylin’ ninja of gnomes A ninja who listens to music while he does his work, that’s all we know about this very ninja. Or maybe it’s more than that. Maybe we have the wrong thread and have been knitting all this time while we fail to see what’s being shrouded by the toasty new avatar of the internet. Oh hell, forget about it. Let’s just go with the random assumption that we know nothing about this ninja, besides that he’s peaceful, a cross-dresser, and so deadly that he even goes
