Transcriptional switching and interactions with dimethylsulfate-DNA at the direction of transcription of the double-stranded DNA plasmid pLV5018 in *Listeria monocytogenes*. *Listeria monocytogenes* has two known nucleoid-associated proteins, NAP1 and NAP2. In this study, transcriptional initiation and termination at the double-stranded DNA plasmid pLV5018 were analyzed by RNA-DNA hybridizations and dimethylsulfate (DMS) interference. In vivo, three more sites were located within the protein-coding region. These sites were transcribed along with the entire coding region. DMS was found to inhibit transcription at the T(A)(3)(G) tract in the coding region. This inhibition was partly reversed when the DMS treated sample was hybridized with a labeled transcription priming template. The sites of transcription initiation and termination were mapped within a 1,388 bp region in the plasmid
