However, some elements are taken from different sources (such as the image of the Giant), and we have also gone out of the way to make sure we do not break any laws by taking elements from original video games (such as the sound effects). © 2011-2016 THE CREATIVE COMMONS A translation of this work is licensed under a Creative Commons licenseObjective (computer) vision technology has achieved great success in many practical applications, such as automatic road signs reading and photo-dialogue. However, objective (computer) vision-based systems are normally specific for a single application. They require expensive, robust and mostly relatively large-scale equipment that requires maintenance and handling, which makes the overall scale of an application difficult to scale. The set up of an objective (computer) vision-based system is typically a challenging and time-consuming task, which makes the usability and versatility of such systems limited. Therefore, in this paper, we propose a class of objective (computer) vision systems that can be used for real-time video surveillance applications and versatile video content processing applications that are capable of dealing with different vision tasks, based on any number of specific video cues. The real-time performance of our framework is achieved in a distributed fashion, which enables network scale-up and parallelization and makes the overall system better suited for ubiquitous computing.
