Phasing If the drawing is included within a model, the drawing is phased in the model using parent/child relationships. When the model is saved, the drawing appears to be copied into the model. The drawing is not created physically, but appears so from the perspective of the drawing document. When the phase information is saved, the drawing becomes independent of the model. Examples The following examples create an object called Linear, sets the coordinates for the origin, translates it five units down and left and then rotates it -45 degrees

counterclockwise. Linear 0 0 5 10 20 0 0 0 0 10 0 20
5 end Coordinates for an object, shown here in
dotted lines, can be entered by using the numbers
immediately to the left of the line separator. For
example, the coordinates of the first line shown
above can be entered by typing 0 5 10 10 0 0 10 0
20 5. The first line sets the origin. The last line,
which specifies the first point of the line, specifies
the line. Euler 0 5 0 0 0 10 20 0 0 0 0 0 0 0 0 0 0

Models Planes can be used to define two-
dimensional space. A model can have several layers
of planar elements. In the following example, a
plane is used to draw a rectangle. SetCADFigure(3)
Linear (10,10,10,10) End A linear object is a set of
points defined by values for the x- and y-
coordinates. A linear object is a model element that
can be manipulated as a whole or by parts. Linear 0
