Q: How to use objective-C collection if it contains a NSDictionary How can I get data if my NSArray contains a NSDictionary? A: What you are describing is called a Transformable protocol. This is an informal protocol used by Cocoa to allow the objects in an array or NSDictionary to work with arbitrary collection classes. For example, NSArray has toString,

but NSDictionary doesn't, so the transformable protocol is used to allow the two objects to coexist. If you attempt to use a NSArray with a NSDictionary, the transformable protocol is used to convert the objects for the NSDictionary. You can think of this as similar to how NSArray conforms to NSCoder and NSCoder, and NSDictionary conforms to NSCopying and NSCoder. They all use the same protocol, but they each provide additional functionality based on

the requirements of their specific type. So, how do you use the NSDictionary in a collection of NSObject? You just need to support the transformable protocol. When you change a property, the transformable protocol is used to convert the object to a new type. For example, you could 6d1f23a050
