This makes it difficult to achieve a sufficient amount of natural light under a limited space while maintaining a comfortable environment in the building.

Accordingly, in recent years, an LED module has been applied to a lighting device, which, in a manner similar to a lighting device using a conventional light bulb or the like, emits light by using a light-emitting diode as a light-emitting source, whereby the LED module is used as a backlight. If the light-emitting source of a backlight is replaced with an LED, since the temperature of the backlight falls, a heat amount of the LED differs depending on the place of installation. For this reason, a change in a temperature distribution in the backlight is likely to be caused. In particular, as the distance from a case of the backlight increases, the density of wiring increases and thus, heat is transferred to a lighting device, the heat is transferred to the LED having a relatively high temperature, and a change in a temperature distribution in the backlight is likely to be caused. As the change in a temperature distribution in the backlight increases, a difference in a luminance distribution in the backlight increases, thereby causing nonuniformity in brightness. In a conventional lighting device, a heat dissipation member is disposed on the backlight, and a heat sink or the like is attached to the heat dissipation member, thereby allowing heat generated in the backlight to be dissipated. In addition, there has been proposed a lighting device in which a heat dissipation member is disposed on an upper surface of a backlight to dissipate heat generated in a light source.I'M HEADING FOR THE PIPELINE I'm heading for the pipeline. Not just because the idea of losing just about any part of my life, even my being, is out of the question, but also because, last Monday, I finally got the latest letter from the doctor. It told me, without saying it, that my blood work was starting to show that c6a93da74d
